

**00) A look at some of the oddball species that paleontologists have recently discovered.**

Newest dinosaur species discovered have smashed previous records. Top left: Michael Skrepnick/Dinosaurs in Art/Nature Publishing Group via AP; center: Chuang Zhao; bottom left: Julius T. Csotonyi/Courtesy of the Royal Tyrrell Museum; bottom center: Julius T. Csotonyi/North Carolina State University; top right: Dinostar Co. Ltd.; top center: Gabriel Lio/University of Birmingham via Reuters; center right: James Havens

**01) 'Pinocchio rex'** Sporting a narrow beak-like snout, the *Qianzhousaurus sinensis* also goes by the nickname "Pinocchio rex." A cousin of the *T. rex*, the species stalked Asia shortly before the dinosaurs' extinction. (Chuang Zhao)

**02) Record-setting arms** First, they found the enormous arms. At nearly eight feet long, they set the record for the longest arms on a two-legged creature. When scientists found two more partial skeletons, a more complete picture of this odd dinosaur emerged. The *Deinocheirus mirificus* features a duck-like snout and a flared spine. (Michael Skrepnick/Dinosaurs in Art/Nature Publishing Group/via AP)

**03) The Dreadnoughtus** Paleontologist Kenneth Lacovara spotted a six-foot-long femur in Argentina poking out of the ground. That led to the discovery of *Dreadnoughtus schrani*, one of the most massive dinosaurs of all time. (Mark A. Klingler/Carnegie Museum of Natural History via AFP/Getty Images)

**04) The 'Chicken From Hell'** Scientists found three specimens of a beaked 11-foot-long dinosaur, the *Anzu wyliei*, with a shock of feathers and a bony crest. Matthew Lamanna spent nearly a decade studying the bones, found in North and South Dakota. (Mark A. Klingler/Carnegie Museum of Natural History)

**05) Wendiceratops** Discovered by a fossil hunter in Canada, the *Wendiceratops pinhornensis* sported a frilly headpiece and an unusually long nose horn for its time period. (Danielle Dufault )

**06) Four-winged dinosaur** This dinosaur, with its array of teeth and claws, was found in Liaoning, China. The *Changyuraptor yangyi* also sported the longest feathers ever discovered on a dinosaur; its name references this characteristic. (S. Abramowicz/Courtesy of the Natural History Museum of Los Angeles County)

**07) A turkey-sized dinosaur** The *Chilesaurus diegosuarezi*, an herbivore with tiny forearms, is named for the boy who at age 7 found the first bone of the species. (Gabriel Lio/University of Birmingham via Reuters )

**08) 'Hellboy'** The discovery of the triceratops relative *Regaliceratops peterhewsi* was crucial in determining that the two groups of horned dinosaurs evolved their features independently. (Julius T. Csotonyi/Courtesy of the Royal Tyrrell Museum )

**09) Alaskan dinosaur** Researchers discovered thousands of bones of the duck-billed dinosaur, *Ugrunaaluk kuukpikensis*, in Alaska. Evidence of the species thriving in cold latitudes added to the discussion about whether dinosaurs were coldblooded. (James Havens)

**10) Wings, but not for flying** The *Zhenyuanlong suni*, a bird-like dinosaur discovered in China, is believed to have evolved from a flying species. Scientists say the short forelimbs would have prevented it from flying, but may have still been used in courtship displays. (Chuang Zhao)

**11) Rhinorex** The four-ton *Rhinorex condrupus* features an unmistakable crested nose, potentially meant for impressing the opposite sex or even smashing plants for sustenance. (Julius T. Csotonyi/North Carolina State University)

**12) Shortest dinosaur name ever** The *Yi qi*'s unusually long bone on each arm led scientists to believe that this tiny dinosaur may have had bat-like wings. (Dinostar Co. )

**13) 'The little dinosaur that could'** The diminutive *Aquilops americanus* is the oldest horned dinosaur ever found in North America. (Brian Engh/Courtesy of Raymond M. Alf Museum of Paleontology)

**14) 'Dragon' dinosaur** Construction workers in central China stumbled upon fossils of the *Qijianglong*, which clocked in at 45 feet long. Many of the dinosaurs with the longest necks recorded were found in China. (Xing Lida)

**15) First swimming dinosaur** The *Spinosaurus aegyptiacus* was not only nearly 10 feet longer than the largest *Tyrannosaurus rex* found, but it is the first swimming dinosaur discovered. Plus, it loved to snack on sharks. (Bill O'Leary/The Washington Post)

**16) Velociraptor's cousin** This species combines the velociraptor's agile design and pack-hunting mentality with a powerful nose. Believed to have been a fearsome predator, the *Saurornitholestes sullivan* was three feet tall and six feet long. (Mary P. Williams/University of Pennsylvania)
